Fractures | Health information | Bupa UK A transverse fracture is when your bone has a horizontal break along your bone. An oblique fracture is when you break the bone at an angle. An intra-articular fracture is a fracture that extends into your joint. Compression fractures are when you get broken vertebrae in your spine. The vertebrae (back bone) collapse onto itself and get squashed. Fractures: Types, causes, symptoms, and treatment There are several different ways in which a bone can fracture; for example, a break to the bone that does not damage surrounding tissue or tear through the skin is known as a closed fracture. Bone fracture - Wikipedia A bone fracture may be the result of high force impact or stress, or a minimal trauma injury as a result of certain medical conditions that weaken the bones, such as osteoporosis, osteopenia, bone cancer, or osteogenesis imperfecta, where the fracture is then properly termed a pathologic fracture.

Ways to Break the Ankle and Possible Complications | New ... Whenever a bone in your body cracks or breaks, it results in a fracture. Three dissimilar bones in your ankle are prone to fracture: tibia, fibula and talus. Tibia is the bigger of the main two bones in your lower leg and the fibula is basically the thinner bone of the main two bones in your lower. Fracture | Definition and Patient Education A fracture is a broken bone. It can range from a thin crack to a complete break. Bone can fracture crosswise, lengthwise, in several places, or into many pieces. How to Diagnose and Treat a Foot Fracture: Expert Advice A fracture is a break in your bone or the surrounding cartilage, and the severity of a foot fracture can range from what is called a "hairline" or "stress" fracture to a full break across the foot. A foot fracture will cause significant discomfort, especially because the foot is a weight-bearing bone. Fractures of the feet are most common in runners, basketball players, football players, or.
